# Event Planning & Vendor Marketplace Platform

Final Project Presentation - Software Project Management Plan

**Team 3** Ayaz Mohiuddin - Dev Singh - Loi A Nguyen - Nabintou Fofana

SE 4381.0W1 - Software Project Planning & Management | Professor Wafa Jaffal | Summer 2026

# Presentation Roadmap

1. **Overview & Scope**
   The problem, users, goals, and boundaries

2. **Work Breakdown Structure**
   How we divided and estimated the work

3. **Schedule**
   Network diagram, critical path, and Gantt

4. **Budget & Resources**
   Effort, cost, and budget performance

5. **Risk Management**
   Risks, mitigation, and what occurred

6. **Performance, Closure & Lessons**
   Earned value, outcome, and reflection

# 1. Project Overview

### WHAT IT IS

A two-sided marketplace that lets event customers discover, compare, and book vendors - and lets vendors manage a storefront - in one responsive web application.

### THE PROBLEM IT SOLVES

Planning an event means juggling many vendors separately - contacting each one, comparing quotes in different formats, with no single view of bookings, budget, or progress. It is slow and fragmented.

*Delivered as a responsive web app on a shared backend (Assignments 1-6).*

### TARGET USERS

**Customers**

Plan events; find, compare, and book vendors

**Vendors**

List services, manage availability, win bookings

**Administrators**

Verify vendors, moderate content, keep trust

# 2. Project Scope

Goals, boundaries, and major deliverables

### PROJECT GOALS

- Bring customers and vendors together in one platform
- Cut the time and effort to find and book vendors
- Give vendors visibility and simple booking management
- Deliver a secure, responsive, easy-to-use experience

### IN SCOPE

- Accounts & secure login (customer / vendor / admin)
- Vendor profiles, listings, search & filtering
- Event workspace with budget tracker
- Booking requests, messaging, reviews, admin console

### MAJOR DELIVERABLES

**- Scope & user stories - WBS & cost estimate**
**- Project schedule (network, CPM, Gantt)**
**- Risk management plan - performance evaluation (EVM)**

### OUT OF SCOPE

- Online payment processing (booking requests only)
- Native mobile app; AI planning assistant
- Delivery / logistics, ticket sales
- Multi-language / multi-currency at launch

# Requirements - Key User Stories

Standard form with testable acceptance criteria (MoSCoW prioritized)

**CUSTOMER**

"As a customer, I want to register & log in securely to access my events and saved vendors."

**CUSTOMER**

"As a customer, I want to search & filter vendors by category, budget, location, and rating."

**CUSTOMER**

"As a customer, I want to send a booking request to a vendor and track its status."

**CUSTOMER**

"As a customer, I want to message a vendor and track my event budget in one workspace."

**VENDOR**

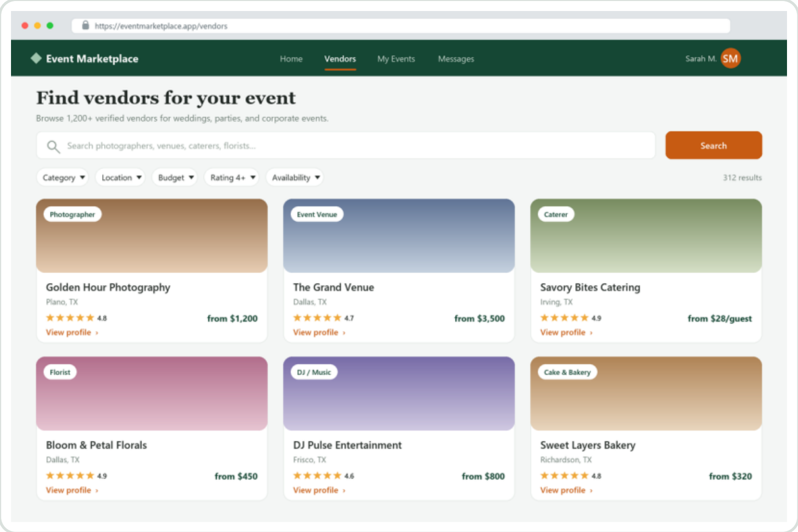
"As a vendor, I want to create a profile and manage my services and availability calendar."

**ADMIN**

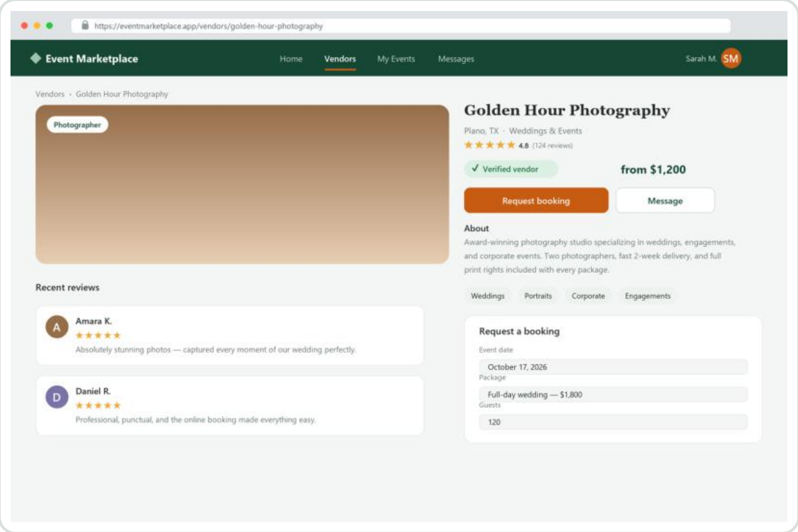
"As an admin, I want to verify vendors so customers can trust the marketplace."

# The Delivered Application

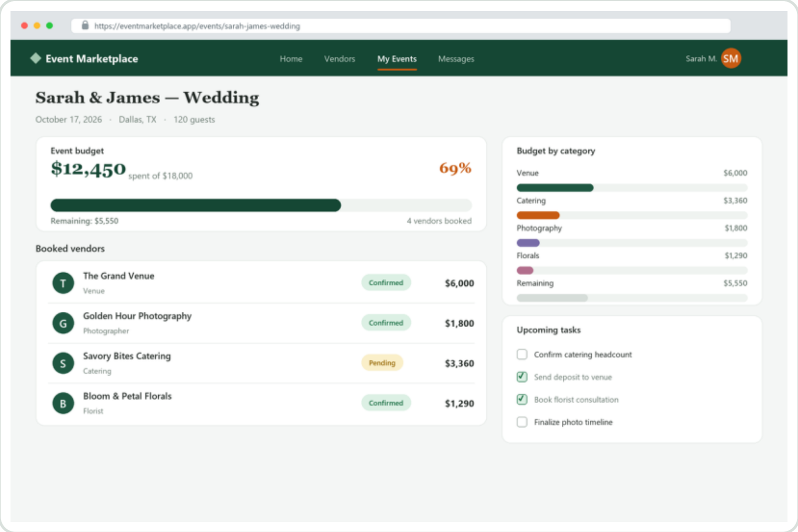
What we planned, delivered - the customer experience



Search & filter 1,200+ verified vendors



Vendor profiles with reviews & instant booking



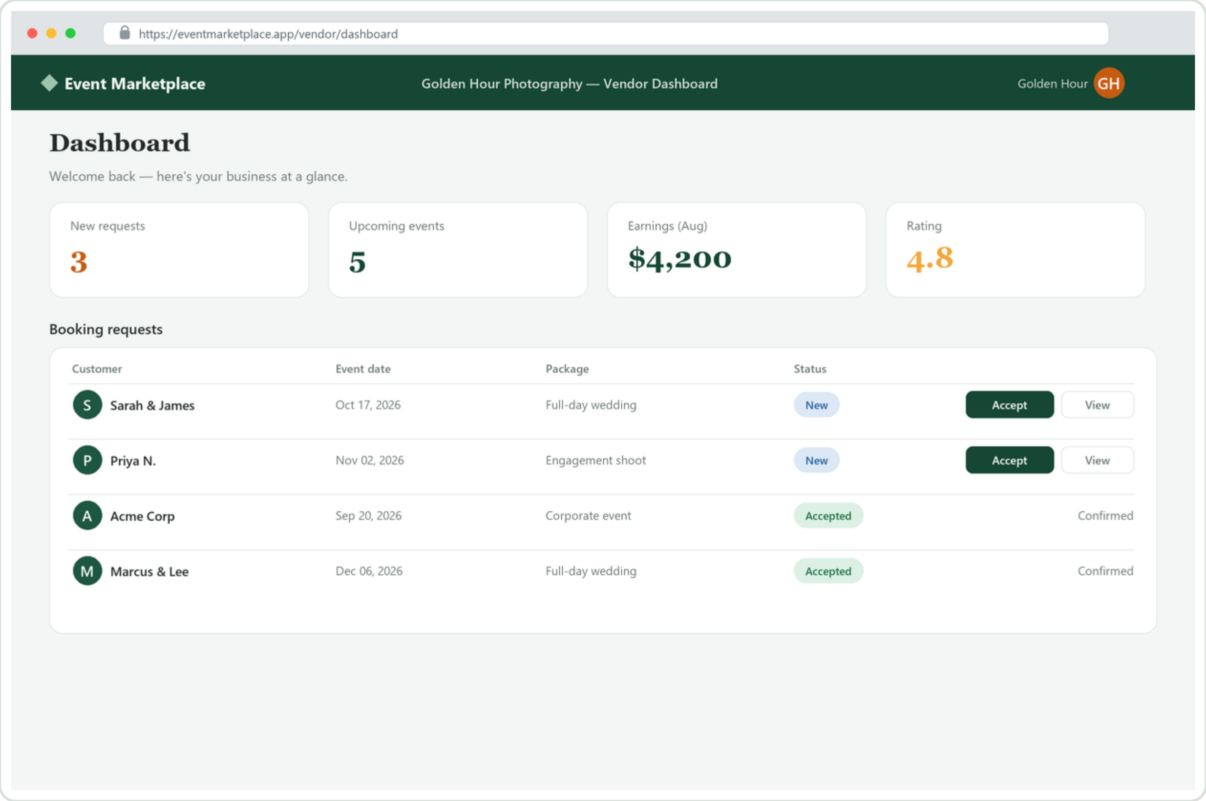
Event workspace with a live budget tracker

**Note:**

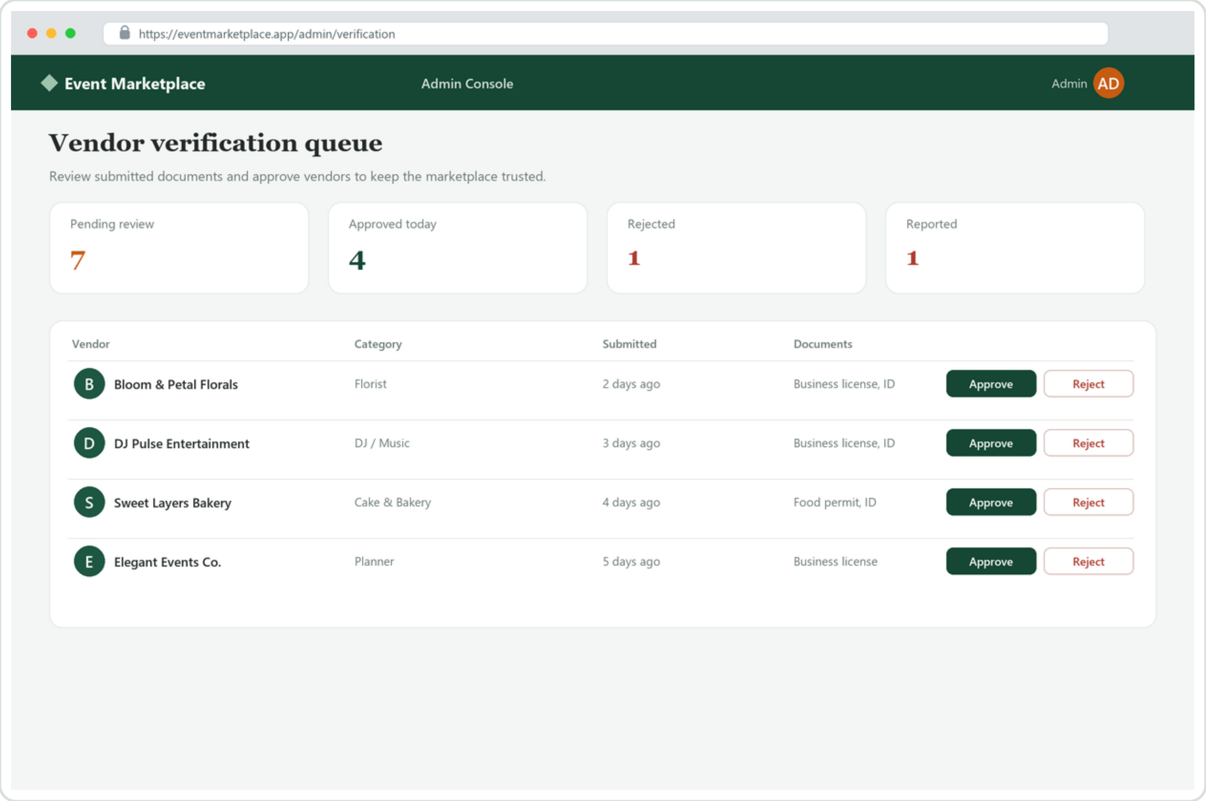
*high-fidelity product mock-ups illustrating the planned scope - this course delivers the project management plan, not production code.*

# The Delivered Application

The vendor and administrator side



Vendor dashboard - manage requests, bookings & earnings



Admin console - verify vendors to keep the marketplace trusted

*Three roles, one platform: customers plan and book, vendors sell and manage, administrators keep it trusted - exactly the three user groups defined in our scope.*

# 3. Work Breakdown Structure

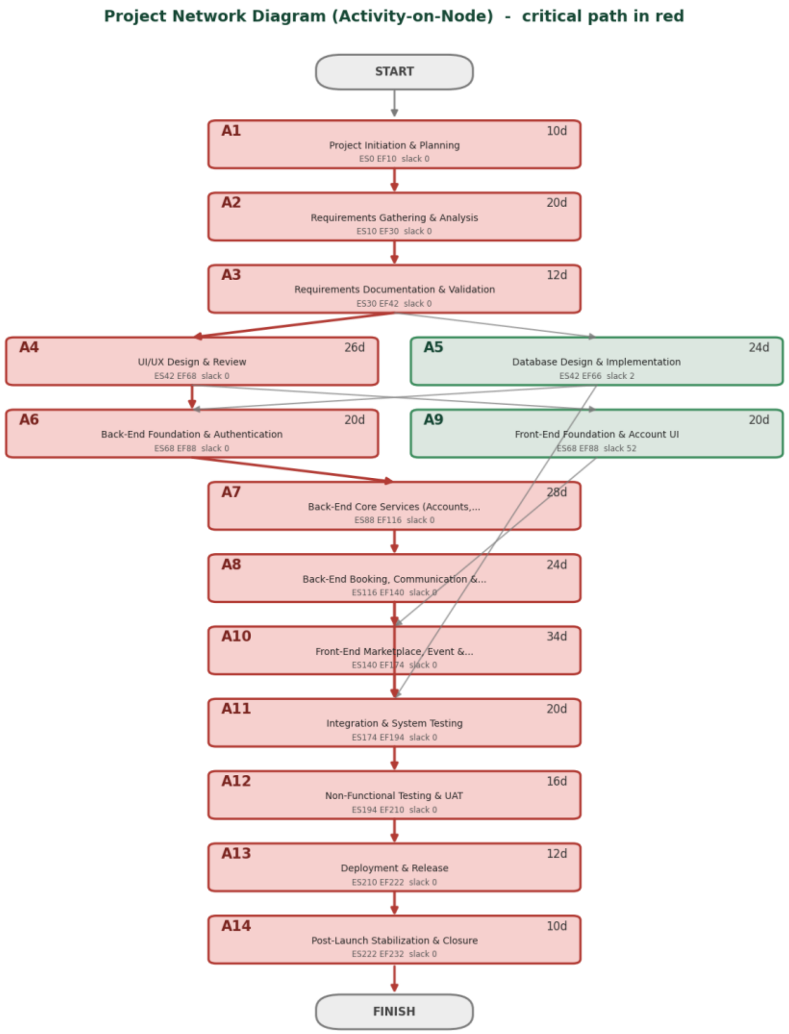
70 work packages, 8 phases, three levels - the basis for cost and schedule

| | |
|---|---|
| 1 | Project Management |
| 2 | Requirements |
| 3 | UI / UX Design |
| 4 | Database |
| 5 | Back-End & API |
| 6 | Front-End Web |
| 7 | Quality Assurance |
| 8 | Deployment |

**How we divided the work:**

each phase breaks into sub-groups and then individual work packages (Phase > 5.2 > 5.2.1). Every package carries an effort estimate in days and a responsible role - about 1,338 person-days total - which feeds both the cost estimate and the schedule.

# 4. Project Schedule - Network & Critical Path



## Activity-on-Node network

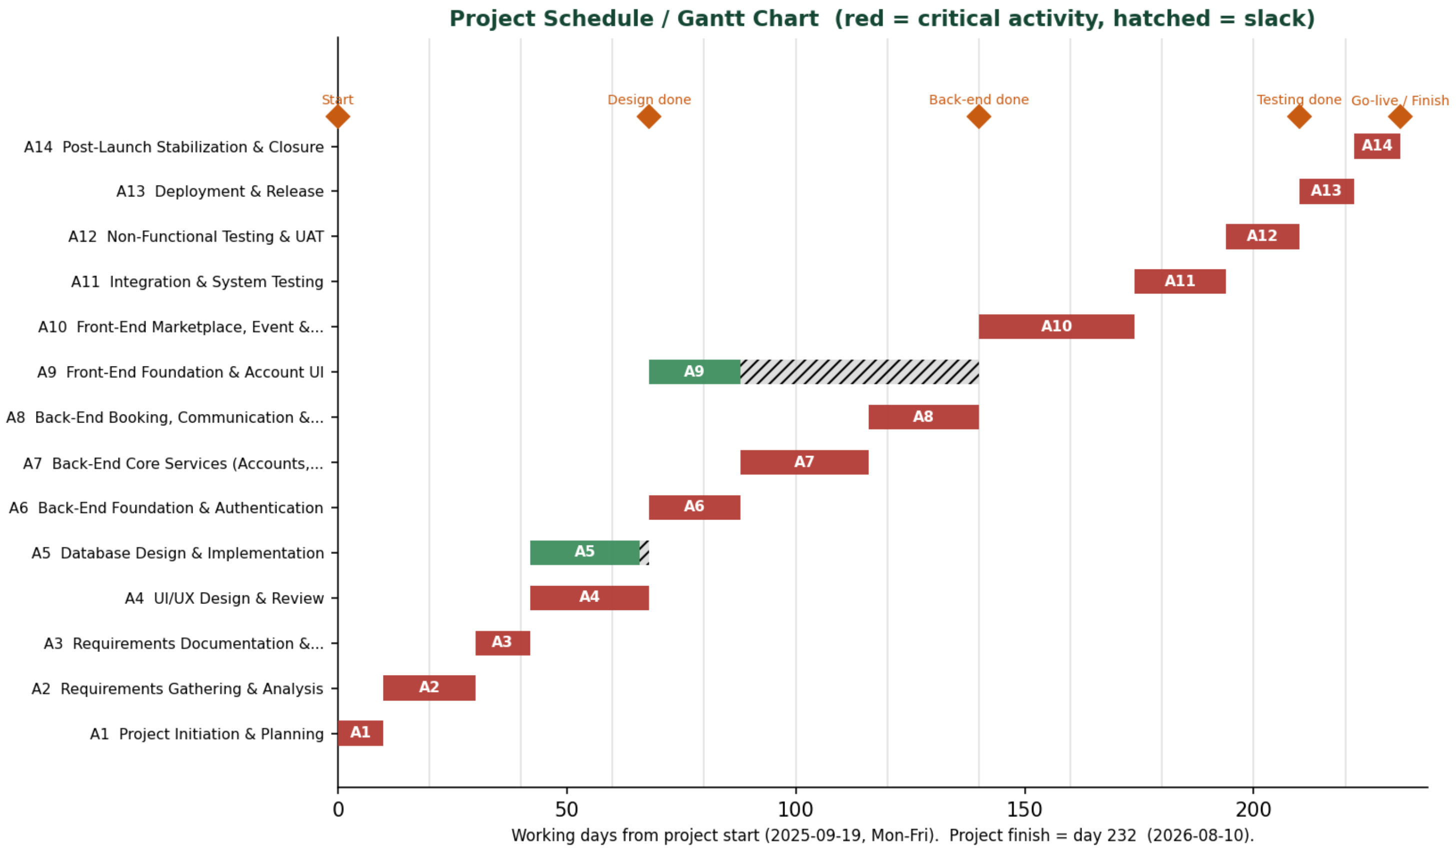
- 14 scheduled activities from Start to Finish
- Finish-to-Start dependencies throughout
- Forward & backward pass give ES/EF/LS/LF and slack

**Critical path (red):**

Requirements > Design > Back-End > Front-End UI > Testing > Deployment

*12 of 14 activities are critical - very little slack, so the back-end chain drives the finish date.*

# 4. Project Schedule - Gantt & Milestones



**232**

working days

**~11 mo**

planned duration

**Aug 10**

on-time go-live

## On schedule?

Yes. Planned duration was ~11 months (Sep 19, 2025 - Aug 10, 2026). An early back-end slip at the mid-point was corrected (see Performance), and the project finished on its planned date - all 232 working days as scheduled.

# 5. Budget & Resource Summary

Cost = estimated days x 8 hours x role rate

# $843,120

Estimated cost (BAC) - ~1,338 person-days of effort

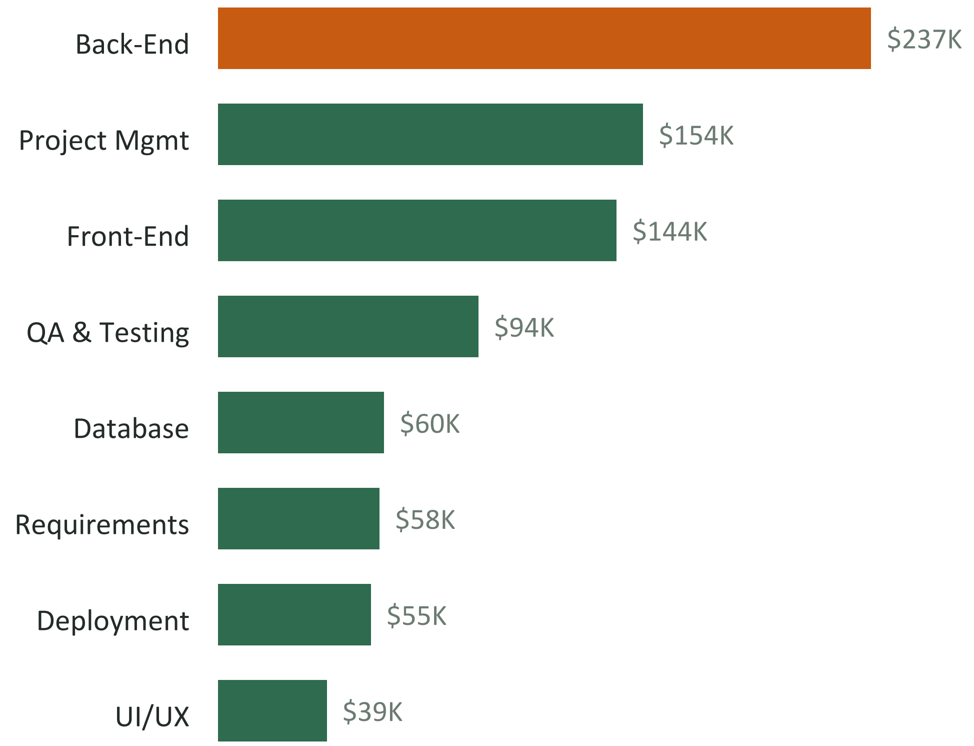
**$3,000,000 approved budget**

**Final actual cost $843,120 - on budget (CPI 1.00).**

Delivered for ~28% of the approved ceiling with no cost overrun; the under-budget cushion from early phases funded the schedule recovery.

*Rates: QA $50 - UI/UX $60 - Front-End $70 - DBA $80 - Back-End $100/hr (PM/BA assumed).*

**Effort / cost by phase**



# 6. Risk Management

12 risks assessed by likelihood, impact, and detection difficulty

**Probability**

| | Impact: Low | Impact: Medium | Impact: High |
|---|---|---|---|
| High | | | R-01 |
| Medium | | R-03 R-05 R-07 R-11 R-12 | R-02 R-04 R-06 R-08 R-10 |
| Low | | R-09 | |

## Highest-priority risks & mitigation

- **01** Back-end critical-path delay — **Mitigate**
- **06** Security breach / data exposure — **Mitigate**
- **04** Too few vendors at launch — **Mitigate**
- **08** Key-person loss — **Mitigate**
- **10** Late-stage major defects — **Mitigate**
- **02** Scope creep (payments, mobile) — **Avoid**

**Risk that occurred:**

the back-end delay (R-01) partially materialized - it shows up in our performance data as a small schedule slip - and was handled with the corrective actions on the next slides.

# 7. Project Performance - Earned Value

Final result at project completion (monitoring & control)

**SPI**

**1.00**

Schedule - finished on time

**CPI**

**1.00**

Cost - on budget

**100%**

**complete**

Earned $843K of $843K

**Overall health:** **GREEN**

Met both goals: the project finished on schedule (SPI 1.00) and on budget (CPI 1.00), with zero final variance (SV = $0, CV = $0). Earlier, at the ~50% checkpoint, it was slightly behind - SPI 0.94, the back-end risk we had flagged - but corrective action reallocating a developer and using schedule reserve brought it back on plan.

# 7. Performance - How We Recovered & Finished

FINAL RESULT

**On time**
**& on budget**

Finished: Aug 10, 2026

Final cost: $843,120

Schedule + cost variance: $0

**All 8 phases delivered.**

1

### Reallocated a developer

Moved a developer from a float task (Front-End Foundation, 52 days of slack) onto the back-end critical path.

2

### Used schedule reserve

Applied part of the schedule reserve and - being under budget - limited overtime on critical tasks to close the gap.

3

### Tightened weekly monitoring

Tracked SV, CV, SPI, and CPI every week, with an owner and recovery date for each late task until back on plan.

# 8. Project Closure

### Final outcome

The platform's full plan was executed and delivered - all eight phases complete. The project finished on its planned date (Aug 10, 2026) and on budget at $843,120.

### Objectives achieved

Yes - every objective met. Scope, WBS, schedule, risk, and performance all delivered and consistent; Assignment 1 scored 100%.

### Overall success

Successful: on time and on budget, well within the $3M ceiling, with earned-value metrics that caught an early slip and guided a mid-course recovery.

### Recommendations

Keep schedule reserve on the back-end critical path, front-load risk mitigation, and phase Could-have features (payments, mobile) into a later release.

# 9. Lessons Learned

| | |
|---|---|
| > **What we learned** | Scope drives everything - cost, schedule, and risk all flow from it - and tracking progress with data lets you catch and fix problems early. |
| > **Biggest challenge** | Keeping every deliverable consistent (the same BAC, PV, EV, AC) and estimating effort realistically. |
| > **What we'd do differently** | Set scope boundaries earlier and build schedule reserve on the critical path from the start. |
| > **Most valuable concepts** | WBS, the Critical Path Method, the risk severity matrix, and Earned Value Management. |
| > **For our careers** | These techniques apply directly to real software projects - scoping, scheduling, risk, and tracking progress with data. |
